

Q: How to set up Linksys

A:

1. Open your browser and type in the address to your router (usually 192.168.1.1) in the address field and login.
2. Go to *Applications & Gaming*, Subsection *Port Range Forwarding*

The screenshot shows the 'Applications & Gaming' configuration page on a Linksys router. The 'Port Range Forwarding' section is active, displaying a table with the following configuration:

Port Range					
Application	Start to	End	Protocol	IP Address	Enable
DC++	612	to 612	Both	192.168.1.102	<input checked="" type="checkbox"/>

3. Type in a single port for the *Start to* and *End*. Select *Both* for the Protocol.
4. Type in your local IP address. (Win 9x: Start > Run > winipcfg | Win 2k/XP: Start > Run > "cmd /k ipconfig /all" [without the ""])
5. In DC++ settings, enter your current external IP (can be found [here](#)) and the port you chose to forward.
6. If you can search and download files you have configured it successfully.
